

**Starter:**

Look at the questions and prepare to answer verbally:

1. If a patient has some **scarring** after a procedure and it is **getting them down**, how can you help them to feel more positive?
2. In your opinion, what is the best **route** to develop yourself in the medical profession?
3. What is the most effective way for an **amputee** to **regain** their independence after surgery?

**Vocabulary this week:**

This week, you will be given a set of sentences with the key vocabulary **highlighted** in the text.

Unfortunately, all of the key words are in the wrong sentences and so you need to work with other students in a small group to rearrange the words and put them into the correct position in the sentences.

You will have a maximum of 20 minutes to do this.

### Vocabulary Activity:

In groups, rearrange the **key** vocabulary in the sentences so that they are correct:

1. I suppose it could be important, so I wanted you to know from the **vary**.
2. Today we have electronic **snotty** and electronic record systems and so on.
3. Fiona gets a bit of eczema which flares up from time to time, but it always **indication** again once we apply the ointment the GP gave us. It seems to **outset**.
4. People are seeing these results straightaway without a doctor there to help interpret them. It's a massive **portals**.
5. She had no appetite at all. I tried various ways of **do the trick** her, but none of them worked.
6. If they can't **struck** this out, they're going to get anxious and that's not something we want to happen.
7. Then, I noticed she kept getting **intuitive** with her brothers. I mean, that's not like her at all.
8. That's not necessarily **coaxing** for people. It's not even true for other tests. For example, haematocrit is also expressed as a percentage, but haematocrit can **dies down** between thirty and sixty percent.
9. The other thing was that her eyes were a bit **peeling**, you know, a bit of conjunctivitis.
10. We started with a more complex visual in the form of a graph, and this did give more information, it showed the **shift** to which figures were increasing or decreasing.
11. She woke up at five am, crying **gunky**.
12. We think that what the patient needs is just a clear **hysterically** of where they are at one point in time.
13. I turned on the light and the first thing that **extent** me was that the area around her nose and mouth looked strange.
